

# Data Center Power Management

## More Meaningful Connections

### Connected Financial Services

Technology puts the 'service' into financial services, helping to create the connected, accurate and secure experience that today's customer or trading partner expects.

### Control the Power

Unprecedented business demands on financial services institutions have left IT and facilities professionals struggling to balance efficiency and uptime. Increased computing demand and energy costs with contracting IT budgets have compounded these issues, putting both legacy and newly built data centers under immense pressure to deliver on IT capacity while managing power consumption. IT and facility professionals need a transparent view of actual consumption and capacity to begin their journey to optimal data center infrastructure management.

## More Meaningful Technologies

### The Panduit Solution

Panduit has long experience in financial services and other performance critical data center situations. Together with our commitment to research and development in this area, this allows us to offer a complete data center power management solution. Our unique offerings help you define a customized roadmap from your current state to optimal data center operation and energy consumption. SmartZone™ DCIM Solutions combine intelligent hardware for data capture, software platforms that provide information to address operational challenges, and services delivered by our experts to implement your ultimate solution.

## More Meaningful Upsides

### Connect with Panduit

The Panduit end-to-end DCIM solution offers clear advantages for financial service institutions. First and foremost is cost-control and meaningful reductions in operational expenditure. Ongoing real-time monitoring means that issues can be identified and solved immediately avoiding unnecessary downtime, allowing optimal operational efficiency and the ability to maintain high demand service levels. Reduction in power consumption also enhances environmental performance by reducing CO<sub>2</sub> footprint.
